MK-2206 is a potent and selective allosteric inhibitor of Akt (IC_{50} 's: Akt1 = 5 nM, Akt2 = 12 nM, Akt3 = 65 nM) that enhances the *in vitro* and *in vivo* antitumor efficacy of several standard chemotherapeutic agents.¹ It was able to decrease insulin-stimulated glucose uptake, glycogen synthesis and glycogen synthase activity in rat muscle.² MK-2206 induced G1-phase cycle arrest and sensitized HepG2 hepatocellular carcinoma cells to TRAIL-induced apoptosis.³
